Detailed summary

Overview

The team presented a first prototype for an open innovation project on unbiased AI decision-making, focusing mainly on a hiring-related use case. The review highlighted that the concept is promising, but the solution still needs a locally relevant dataset, a clearer model implementation, and more functional depth before it can be considered production-ready.

Project Presented

The team demonstrated a front-end prototype with basic login flow, dataset input options, and a CSV upload path. They explained that the system is intended to accept dataset-driven inputs, analyze several columns and names, and estimate bias or impact levels based on training data.

What the Prototype Currently Does

- Shows a landing page describing the project.
- Includes two login paths, though they are still demo logins.
- Supports adding data manually or uploading a CSV file.
- Lets users add a dataset with multiple columns for analysis.

- Is positioned as a first prototype rather than a fully functional product.

Intended Scope of the Solution

The team described the application as a generic framework that could be applied to multiple domains, including:

- Hiring
- Finance
- Healthcare

They also mentioned that the system could be used to calculate statistics, perform analysis, and generate predictions from uploaded data.

Feedback Given by Simar Preet Singh

Simar Preet Singh focused the discussion on the hiring use case and explained that bias in hiring can appear in regional and language-based discrimination, such as preferring local candidates over people from other states.

Key recommendations included:

- Build a local dataset first, since existing datasets are often international and may not reflect local bias patterns.
- Ensure the system is trained on data prepared for the local market.
- Address adoption barriers, since many organizations still prefer manual decision-making over AI-based systems.
- Consider integration with existing HR, finance, or enterprise systems through APIs.
- Be mindful that financial use cases are more regulated and require stricter compliance.
- Use a proper model rather than relying only on Google Cloud/Gemini API

integration.

- Expand bias checks beyond region and language to include caste-based bias and dialect-based bias.

Clarifications on Technical Approach

The team clarified that they are using Google Cloud APIs/Gemini for processing or interpreting data. Simar Preet Singh acknowledged the integration idea but emphasized that interpretation alone is not enough and that the project still needs a more complete model and stronger domain-specific implementation.

Gaps Identified

The discussion surfaced several missing pieces:

- Functional implementation is incomplete.
- Admin module is only a simple template.
- Core features are not yet developed fully.
- The current system is still a proof-of-concept and needs substantial work to become operational.

Outcome

The review concluded with encouragement to continue working on the prototype and align it more closely with a real local problem, especially bias in hiring. The team was advised to refine the problem statement, strengthen the dataset strategy, and build out the missing functionality before the next iteration.

Transcript

00:00 Brand T.: Okay. So, hi, Simar preet! This is our team Fortune 14. And the problem statement is unbiased air decision under open Innovation.

00:12 M A.C.: This one.

00:13 Brand T.: I can see that your team strength is four, so other members also joining.

00:22 M A.C.: We are sitting together using a single device.

00:25 Brand T.: Okay, okay, understood? So before you guys start, uh, there are a couple of things that I want to mention. You will be getting only 15 minutes of time, and you'll be having 10 minutes to

00:31 M A.C.: Yes. Yes.

00:37 Brand T.: Showcase your prototype. And during this time frame, you can present your screen as well. And the other five minutes you will be having that. As with the winter, where

00:45 M A.C.: Hi, I'm transcribing this call with my Tactiq AI Extension. <https://tactiq.io/r/transcribing>

00:46 Brand T.: you can ask any questions or queries that you have? So, are you ready? Okay, so your time starts now.

01:04 Simar P.S.: Yes, please go ahead and you can share your screen if you want to present.

01:18 M A.C.: So, I think our screen is visible. Yes. So, this is our front faces. Here we are describe about the project. And so we have to two logins and. Login now, just so we have not said. You log in right now, so we are just demo login and I am. This first page is. The CSV file we have just we can. Make it by both. If we don't have CSC also CSV file, also, we can. We can give inputs by using this, this includes, and if he has CSV like this, we can upload.

02:42 Simar P.S.: All right, so. Is the date, or you have to present more?

02:47 M A.C.: Stop the screen.

02:50 Simar P.S.: Yeah.

02:55 M A.C.: Yes, we have. We can add a data set here. So, we have some several columns and names, so it will check for the. Uh, check for groups, and it will check how the level would be. How the impact would be present if they. If we train the model and how it will be, if we have not fully added set. It's just a we have made it for a first prototype, so we want to work on this.

03:30 M A.C.: Like this, we have a different also said how it will be

implementing this set and finance meter. Is this how the statisticals we can be? How these statistics the term can be calculated here as well. And just. We are explaining this here so. Like this, uh, we can do analysis like, so we can add different types of applications using this cell. We have generic Finance and. Health care and hiring types of data sets. We can easily able to. If you integrate with the a Germany means it will be.

04:11 M A.C.: It will be predicting, and then it will be if we upload CSV file means it will give the. Reproduction results. How would a data I will be?

04:21 Simar P.S.: Notifications.

04:27 M A.C.: So, and we have same as admin moduleser. We have same Finish Twitter like things, and we have the. Locks. Sorry, we want to walk more on. We have been not work more on this admin modules. Just, we have done a simple template like this things are we want to. We have to implement more things to do. The project fully functional. That's we have me, and like.

05:06 Simar P.S.: What?

05:09 M A.C.: So?

05:12 Simar P.S.: Uh, is that it, or you have to explain, or you can continue, yeah?

05:15 M A.C.: Yes. For this year, we have idea, but we have not implemented the functionalities of

05:21 Simar P.S.: Okay, got it.

05:23 M A.C.: these projects until now. We are currently working on this. It is the first product what we have made. So, what can be, uh?

05:34 Simar P.S.: Okay, so let me know if if you're done with the Prototype, you can ask me any questions or any suggestions that you want.

05:49 M A.C.: So, how can we get to the use of English? How, how the data scientist and some persons can usually? Data what they look to be in this. This, like platforms.

06:05 Simar P.S.: So, but basically the problem, uh, statement you are targeting. Is that? I am just taking one subset like the hiring one.

06:14 M A.C.: Yes. Yes.

06:16 Simar P.S.: Yeah, so in hiring generally, uh? We have seen in past. That some Regional base, uh? Racism, or that things were done, like people from

up, might not be hired because they are saying they are migraines. And in Bangalore, Punjab people are like targeted, like we will not hire them because they are coming from outside. We will hire only local people something like that, so these kind of racism

06:46 M A.C.: Yes, sir, yes.

06:47 Simar P.S.: exist, and they are biased. Who are that? So these systems. If you are targeting, you need to have a local database first of all. For training your models, right? So?

07:03 M A.C.: Yes.

07:05 Simar P.S.: Because most of the data sets or databases that already exist that I researched about are not locally prepared. They are prepared in.

07:10 M A.C.: Thank you.

07:15 Simar P.S.: International markets.

07:17 M A.C.: Yes, sir.

07:17 Simar P.S.: Right, so these systems will be biased toward them. So, first of all, you need to prepare a data set for your local users.

07:27 M A.C.: Yes, yes.

07:28 Simar P.S.: Only then you will be able to integrate them and the problem you will face in the future will be that. People are not really still, not really aligning to use AI in their these kind of systems.

07:42 M A.C.: Is?

07:42 Simar P.S.: They want to do it manually. So, you have to find a solution for that as well, like. Connecting with the teams like you can make API to incurate with other HS Systems or financial systems. So, Financial part is a little bit more sticker. Stricter because they have some. Like RPI controls all the things, so you have to work in the government's way,

08:11 M A.C.: Yes, yes.

08:12 Simar P.S.: but these Azure systems are more privately working spaces so you can connect with them and see how things work.

08:20 M A.C.: Yes.

08:22 Simar P.S.: So, otherwise, you have to still have to do a lot of work in this project. Like, you have to find a proper a model that you have to implement. How you're using Gemini? I didn't get that part.

08:40 M A.C.: So we are using with the APS using Google Cloud API. We are

getting the ABCs

08:45 Simar P.S.: Like?

08:48 M A.C.: from the we are getting and.

08:49 Simar P.S.: Okay, you are integrating interpreting the data.

08:52 M A.C.: Yes.

08:53 Simar P.S.: Okay, forgot it. Okay. Yeah, that? That's it. Other than that, you will not be able to do anything you can implement the cast based checking as well cast. You should not be. Biasing toward their data should not be biased when the cast Cast. In the region or language or dialect, because most of the South Indian people

09:17 M A.C.: Okay, so.

09:21 Simar P.S.: they don't get a job in. North India because they don't know Hindi or other languages so. But still, they are good to work if they know English. So these things exist in

09:30 M A.C.: Yes.

09:34 Simar P.S.: the system because I have been working in North and I have seen them on first

09:34 M A.C.: Yes.

09:38 Simar P.S.: hand. So, you have to focus on those kind of problems that are really in a problem in local market. Cool anything else?

09:51 M A.C.: Yes, thank you.

09:54 Simar P.S.: I think we are done right now.

10:00 Brand T.: 10 minutes completed, only 5 minutes left

10:03 Simar P.S.: So? If you are done, you can drop off and they will. The team will get back to you.

10:13 Brand T.: Yes, of Innovation. If you are done, then you can drop off. Okay. Thank you. In the meantime, like?
